

MicroPredict — Whitepaper

An on-chain micro prediction market for BOT Chain memecoins — place a stake, watch the odds, collect the settle.

Version 1 · Testnet 968 · September 2026

Abstract

MicroPredict is an on-chain prediction market that lets anyone list a binary event, take either side of it, and get paid out by the pool without trusting an intermediary, a price feed, or a bookmaker's word. Markets take deposits in native BOT or ERC-20, split into two branch pools (A / B), publish fee-honest odds computed live from actual pool sizes, resolve to a winner, and settle automatically. Zero-volume markets and too-small winning pools are voided under a pre-committed threshold the owner cannot silently change per-market after money is in.

It is built for the memecoin beats on BOT Chain: "does BOPE survive the week", "does HIRO clear a liquidity threshold by Friday". Small stakes, fast clocks, honest math.

The problem: prediction markets are either slow or untrustworthy

Prediction platforms usually fail one of three ways:

- **Oracle opacity.** Resolutions come from a black-box data source nobody can inspect, and disputes settle arbitrarily.
- **Fee opacity.** Odds shown to the bettor are net of fees nobody can verify — the house takes as much as the market will bear at settlement time.
- **Late-rule surprises.** Void conditions, minimum-pool cliffs, and fee formulas get invented after money is already committed.

On a blockchain, none of those need to be trust-based.

Mechanics

Markets

Any owner action creates a market with a fixed clock:

- **Duration** — set in hours; the market closes when it expires.
- **Fee (bps)** — a single, visible fee applied at settlement, capped well below abuse.
- **Increments** — bets are staked in either native BOT or the listed ERC-20.

Two pools, live odds

Every market carries two pools, **Side A** and **Side B**. Money flows to one branch and stays there until settlement.

Bettors see:

- **Fee** — the exact deduction per side, computed honestly from the pool.
- **Payout if win** — what that side returns on top of the stake.
- **Net** — the honest profit-or-loss after fees.

The forecast is **fee-honest**: the losing side always subsidizes the fee on the winning side, exactly as the formula reads. There is no hidden spread — the numbers on the receipt are the numbers the contract settles.

Resolution & void

- **Resolve** — the owner names a winner; winning side collects, losing side's stake funds the prize and the fee.
- **Void** — a market with zero(ish) volume, or a winning pool below the set minimum threshold, is voided and stakes are returned. The threshold is **pre-committed on-chain** before betting closes — the owner cannot tighten it to force a void after losing.

Fee withdrawal

Accrued fees sit in the market until it is fully claimed, then the owner withdraws them. No fee escapes the contract, and no fee is taken before resolution.

Architecture

Layer	Piece
Market ledger	Every market: duration, fee, A/B pools, state (open → resolved/voided).
Forecast engine	On-chain read of pool sizes → fee, payout, net for both sides.
Back office	Owner-only: create market, resolve, set void threshold, withdraw fees.
Tickets	Every bet is a held ticket with its own slice of the pool.

Betting flow

```
owner: createMarket(duration, feeBps)
bet:   placeBet(market, side, amount)    — BOT or ERC-20
board: odds board reads live pools → fee / payout / net forecast
close: market expires
owner: resolve(market, winner)           — or void under threshold
settle: winners withdraw; losing stake funds prize + fee
owner: withdrawFees(market)              — after full claim
```

Security & fairness model

- **Fee-honest math.** Odds are derived from actual committed pools; the receipt is the settlement.
- **Pre-committed void threshold.** The minimum winning pool is set before the market is meaningfully funded, and read back as "current" from the contract — not from memory.

- **No credit.** Everything is on-chain; no intermediary holds stakes between bet and settle.
- **Reentrancy-safe settlement.** Claim and fee tracks settle cleanly, one market at a time.

Roadmap

Item	Status
Markets, A/B pools, fee-honest forecast, tickets	Shipped (testnet 968)
Void thresholds pre-committed per market	Shipped
Fee withdrawal per market	Shipped
Responsive odds board (mobile bets)	Shipped
Resolution oracles / dispute window	Next
Leaderboards & points for long-running markets	Parked
Base rails (mirror of BOT Chain)	Parked

No token

MicroPredict needs no governance token to work — the fee is the product, and the markets are the reward. Points-style participation reward is a roadmap item, not a requirement.

Disclaimer

This document describes a prediction market on BOT Chain testnet (968). Markets are binary games with real stakes and real loss risk; past outcomes do not predict future ones. Nothing here is financial advice, and markets with small liquidity may

be voided under their pre-committed thresholds. Bet only what you can afford to lose.
